FINDINGS

Nose: CLEAN

Dental: MILD TARTAR

Eyes: CLEAN

Ears: CLEAN

Skin: CLEAN

Coat: HAIR LOSS THROUGHOUT

Anesthesia - Xylazine/Atropine route: IM, Ket/Diaz route: IV, intubated and maint. on Isoflurane/O2.

Sx. - routine castration, absorbable subcuticular closure, no sutures

After care: No food or water until after 8 p.m. tonight. This will prevent your animal from vomiting. Your pet's appetite may not return to normal for 1-2 days. If your pet seems lethargic after two days please call for assistance. Restrict your pet's activity for 7-10 days. Discourage running, jumping, and heavy play during this time. Leash walks only when outdoors. Check incision daily and watch for abnormal swelling, redness, or discharge. Male dogs may experience some swelling of the scrotum. If postoperative swelling succeeds the pre-surgical size of the scrotum, it should be re-checked. Excessive licking at the incision may indicate or even create a problem. If you notice any problems please call for assistance.

I understand that this animal has been diagnosed with the following medical conditions/problem(s): (SKIN ISSUES COMMON WITH THIS BREED, HAIR LOSS) I understand that he or she will require additional care and treatment at my own private veterinarian's office. I agree to take full responsibility for all veterinary costs in the care and treatment of the aforementioned animal.

Lab Work
Heartworms:

NEGATIVE

There are a variety of products available for preventing heartworm infection, including monthly tablets, and liquids. These products are extremely effective when administered correctly. You and your veterinarian need to discuss your options and decide which medication would be best for your dog. With preventative medication, heartworm disease can be prevented.

ANION GAP	20	12 - 24 mEq/L		
-----------	----	---------------	--	--

TOTAL HEALTH PLUS	T4
-------------------	----

Test	Result	Reference Range	Flag	Bar Graph
T4	0.7	0.9 - 3.9 ug/dL	L	

Interpretive ranges:

<0.9 Low
0.9-3.9 Normal
>3.9 High
2.1-5.4 Therapeutic

Dogs with no clinical signs of hypothyroidism and results within the normal reference range are likely euthyroid. Dogs with low T4 concentrations may be hypothyroid or "euthyroid sick". Occasionally, hypothyroid dogs can have T4 concentrations that are low normal. Dogs with clinical signs of hypothyroidism and low or low normal T4 concentrations may be evaluated further by submission of free T4 and canine TSH. A high T4 concentration in a clinically normal dog is likely variation of normal; however elevations may occur secondary to thyroid autoantibodies or rarely thyroid neoplasia. For dogs on thyroid supplement, acceptable 4-6 hour post pill total T4 concentrations generally fall within the higher end or slightly above the reference range.

Please note: As of April 28, 2009, the reference intervals were adjusted due to a change in assay performance.
